Institut für Vernetzte und Eingebettete Systeme

The Digital Universe

- Forecasts from a recent IDC report [1]
 - „The amount of digital information in the world will grow to almost **35 trillion GByte** by 2020.“
 - “The amount of digital information created **already exceeds the available storage.**” By 2020 this storage gap grows to more than 60 %
 - „**Cameras** play a significant part for data creation“

[1] J. Gantz, D. Reisl. The Digital Universe Decade – Are You Ready?, May 2010
(IDC forecast report)

- **Storing, analyzing, searching, protecting, etc.** these huge amount of data becomes a real challenge

Ubiquitous Cameras

- We are surrounded by **billions of cameras** in public, private and business spaces
- Various well-known examples
 - Transportation
 - Security
 - Entertainment
 - ...
- How to **explore** all the captured data ?
- **Different view on camera(s) required,** applies especially for pervasive computing

Revolution in Cameras

- Ongoing technological advances in
 - lenses
 - image sensors
 - onboard processing
 - networking
- transform camera as box delivering images into **spatially distributed** that generate **data and events**
- Huge amount of **visual information** is processed in a **network of resource-limited embedded** nodes in dynamic environment
- Make cameras **smart, autonomous** and **collaborative**

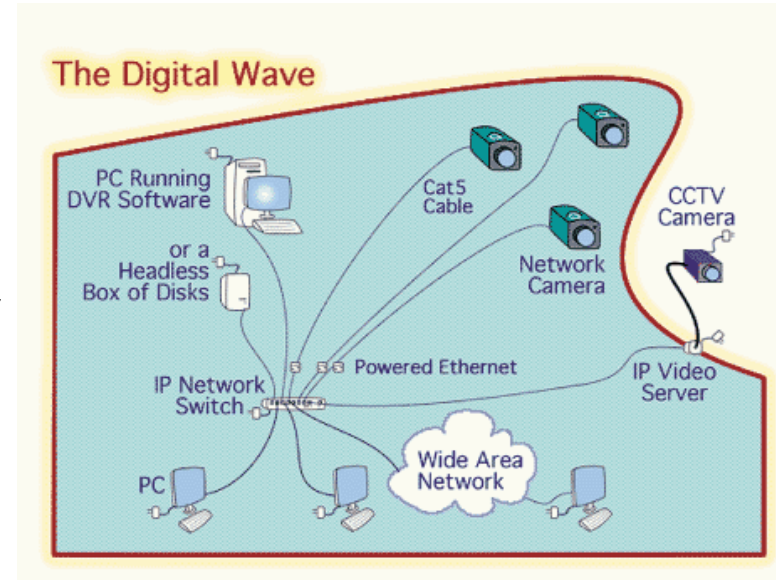

Agenda

- Smart Cameras
 - Introduction
 - Trends
- Selected Applications
 - Tracking
 - Configuration
 - Security & privacy
- Challenges
 - Research question
 - Conclusion

Smart Cameras

Traditional Camera Networks

- Cameras capture images/videos
- Raw or compressed data is **streamed to central server**
- Image data is displayed/archived/
analyzed at central point
- Data and energy is transferred
over wired infrastructure

[Regazzoni et al. Special Issue on Video Communications, Processing and Understanding for Third Generation Surveillance Systems. Proc. IEEE. October 2001]

- **Centralized and static architecture, heavy infrastructure required**

Making Cameras smarter

- Smart cameras integrate **sensing**, **processing** and **communication** on single embedded device

Traditional Camera

- Optics and sensor
- Electronics
- Interfaces

delivers data in form of (encoded) images or videos.

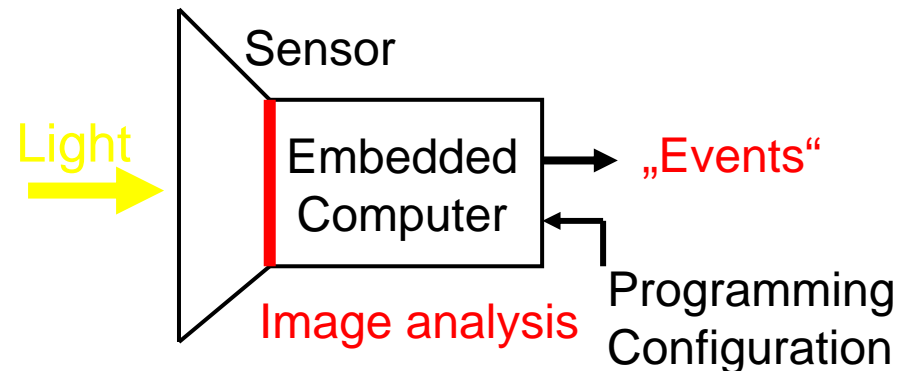

B. Rinner

Smart Camera

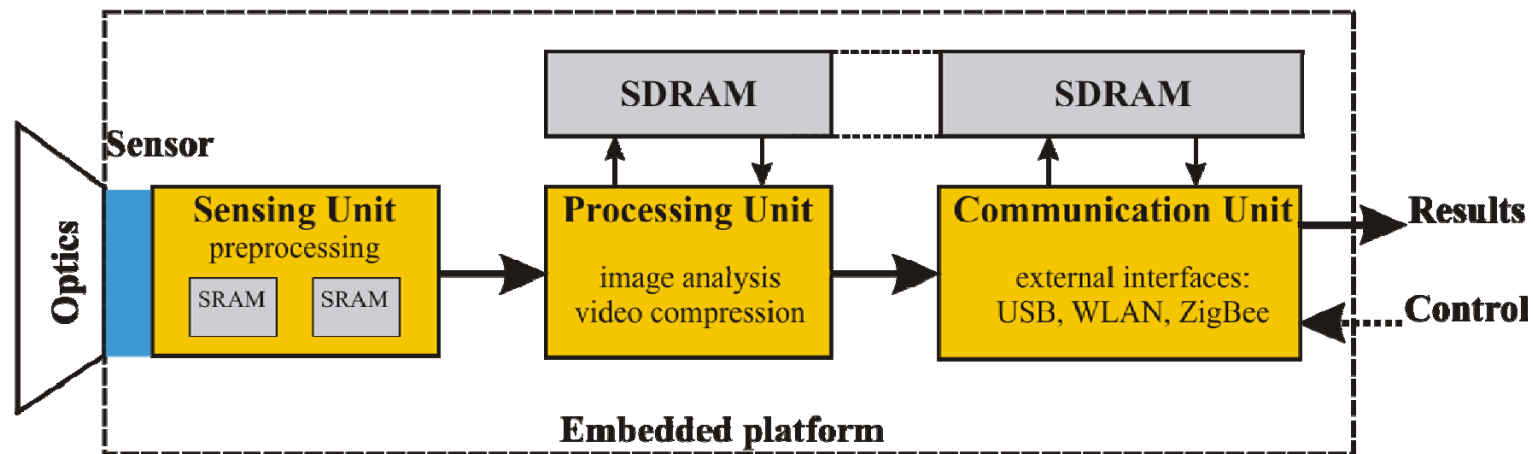

- Optics and sensor
- **Onboard computer**
- Interfaces

delivers **abstracted image data** and is configurable and programmable

Smart Camera Architecture

- Main components

[Rinner, Wolf. Introduction to Distributed Smart Cameras. Proc. IEEE, 96(10):1565–1575, 2008]

Process data where it is captured

- Perform **image and video analysis** in **real-time** closely located at the sensor
- Deliver (only) abstracted events
- Reduce data transfer
 - From raw data to features or events
 - Example: tracking
- “Smart cameras look for important things”

Collaborate spontaneously

Traditional Camera Networks

Cameras stream images/
videos to „server“

Smart Camera Networks

Cameras collaborate directly
(spontaneous, p2p, ad-hoc)

Perform advanced in-network analysis

- From data collection and streaming to **dynamic collaboration**
 - More demanding processing possible (eg., online learning)
 - Analysis may change depending on network state and environment
- Exploit heterogeneous sensors
 - Different cameras (static, PTZ, RGB/IR ...) but also audio, laser etc.
 - Perform intra and/or inter node fusion
 - Synchronization and calibration necessary
- Deliver multimedia data at required QoS level
- Support **autonomous** operation at **network level**
 - Self-* methods

[Akyildiz et al. Wireless Multimedia Sensor Networks: Applications and Testbeds. Proc. IEEE, 2008]

Be aware of scarce Resources

- Major resource limitations
 - Processing power
 - Communication bandwidth
 - Onboard memory
 - Energy
- Various Prototypes

Rinner et al. (multi-DSP)
10 GOPS @ 10Watt

WiCa/NXP (Xetal SIMD)
50 GOPS @ 600mWatt

CMUcam3 (ARM7)
60 MIPS @ 650mW

CITRIC (PXA270)
660 MIPS @ 970mW

[Rinner et al. The Evolution from Single to Pervasive Smart Cameras. Proc. ICDCS 2008]

Why Networks of Smart Cameras?

- Scalability
 - No central server as bottleneck
 - Real-time capabilities
 - Short round-trip times; “active vision”
 - Reliability
 - High degree of redundancy
 - Energy and Data distribution
 - Reduced requirements for infrastructure; easier deployment
 - Sensor coverage
 - Many (cheap) sensors closer at “target”; improved SNR
- Compare with sensor networks

Selected Applications

Quest for Novel Pervasive Applications

- Some requirements
 - Easy deployment
 - Adaptive and scalable
 - Reactive/interactive
 - Secure- and privacy-aware
- **Application domains**
 - Distributed surveillance and security
 - Smart homes / smart buildings
 - Ambient intelligence
 - Human-computer interfaces
 - Mobile and robotic networks
 - Virtual reality systems
 - ...

Example 1: Multi-camera Tracking

- Track mobile objects autonomously among multiple cameras

- Computation follows (physical) object
 - requires spontaneous communication; distributed control & data

Autonomous Migration of Processing

- **Camera Handoff**

- Initialize object tracker on “neighboring” camera(s)
- Similarity function for object re-detection
- Various approaches for **neighbor selection**, eg., a priori definition, learning, virtual markets

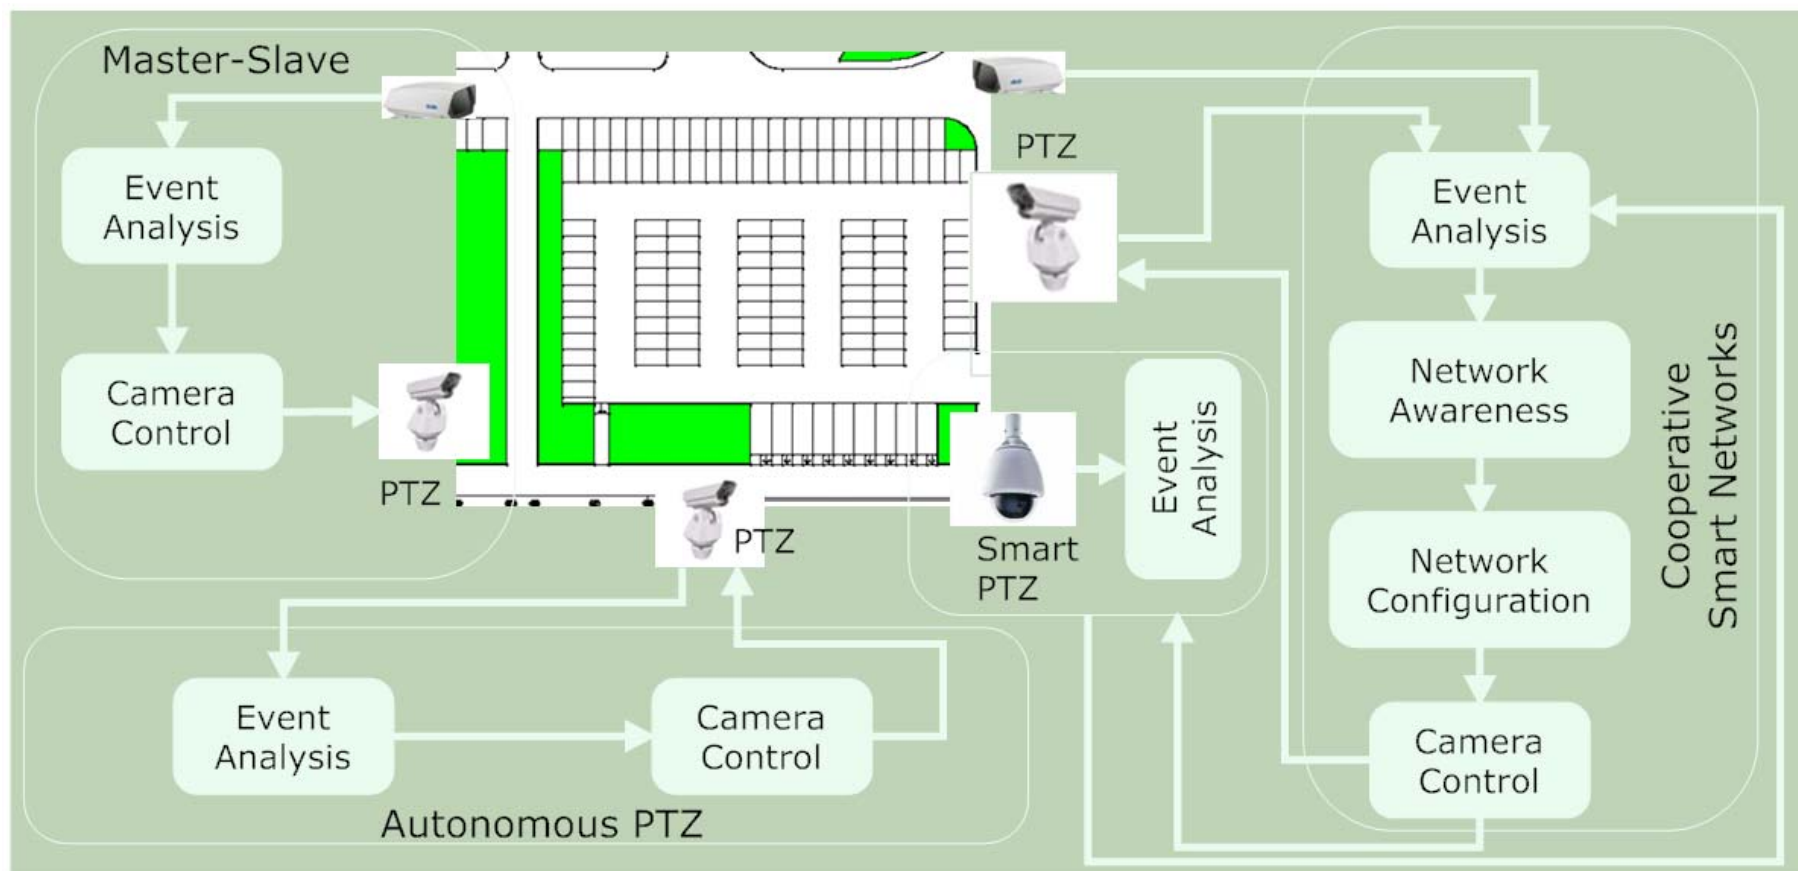

[Quaritsch, Kreuzthaler, Rinner, Bischof, Strobl. Autonomous Multicamera Tracking on Embedded Smart Cameras. EURASIP Journal on Embedded Systems. 2007]

Example 2: Mobile Camera Configuration

- Pan-Tilt-Zoom (PTZ) cameras allow to change their FOV
- Adapt coverage dynamically, eg., to
 - modify area of interest
 - follow targets
- **Active** visual sensor networks have to react in **real-time**
 - Estimate the current state (based on image analysis)
 - Compute the PTZ configuration (based on accurate modeling of 3D coverage)
 - Cooperate among cameras may be required for state estimation
- Comparison of different approaches

[Michelsoni, Rinner, Foresti. Video Analysis in PTZ Camera Networks. IEEE Signal Processing Magazine. Sep. 2010]

Different forms of cooperation

Example 3: Security and Privacy

- System level approach addressing the following security issues in cameras:
 - **Integrity**: detect manipulation of image and video data
 - **Authenticity**: provide evidence about the origin of image and videos
 - **Confidentiality**: make sure that privacy sensitive image data cannot be accessed by an unauthorized party
 - **Multi-level Access Control**: support different abstraction levels and enforce access control for confidential data
- Considered attack types: only software attacks

[Winkler, Rinner. Securing Embedded Smart Cameras with Trusted Computing. EURASIP Journal on Wireless Communications and Networking, 2011]

Our Approach: TrustCAM

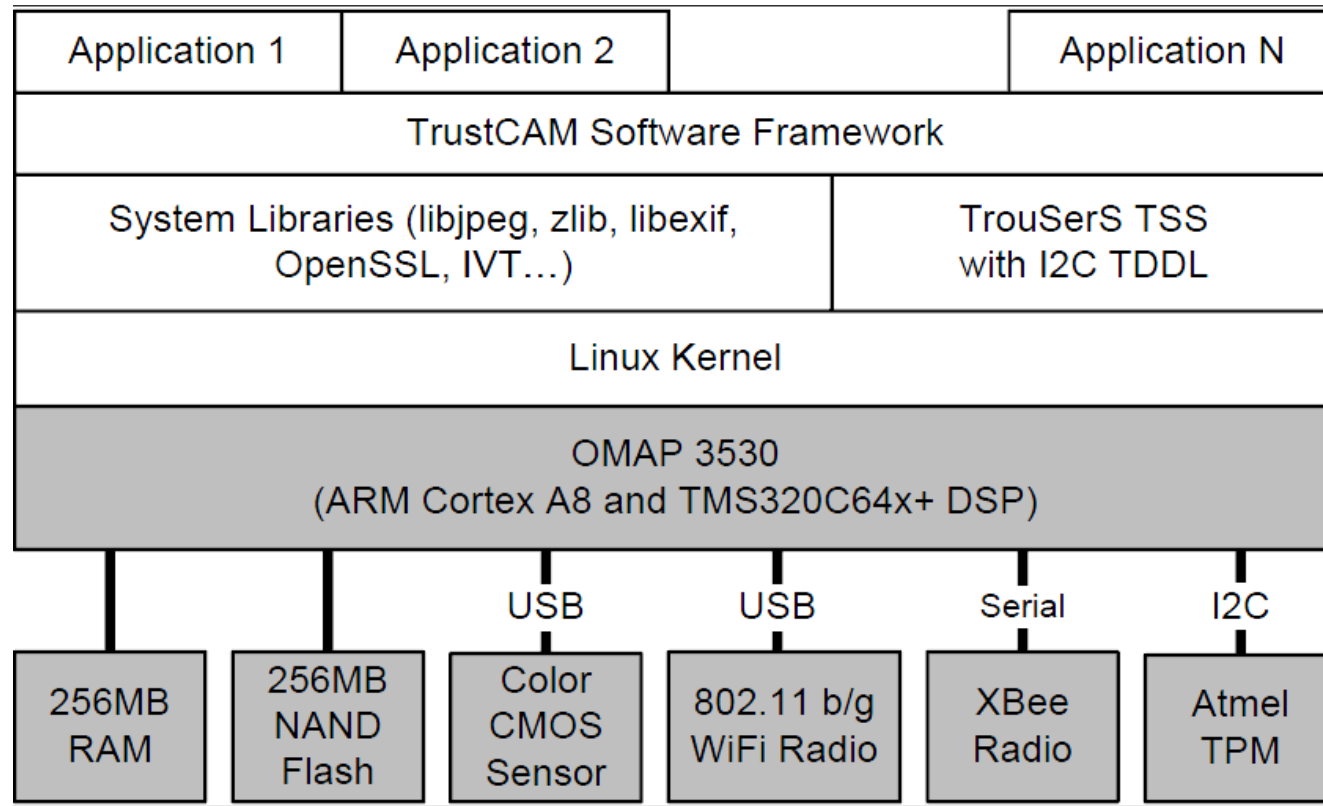

- We integrate **Trusted Computing** into camera prototype
- Trusted Computing (TC) is a **hardware security** solution based on microchip called **Trusted Platform Module (TPM)**
- Reasons for using TPMs:
 - Implement a well defined set of security functions
 - Public and well reviewed specification
 - Cheap and readily available
 - Hardware provides higher security guarantees than software
 - Using established technology is better than re-inventing the wheel (especially when doing security)
- Main challenge: TPMs are relatively slow
- Careful integration into camera is required

TrustCAM Prototype

- TI OMAP 3530 CPU:
ARM @ 480MHz and
DSP @ 430MHz
- 256MB RAM,
SD-Card as mass storage
- VGA color image sensor
- wireless: 802.11b/g WiFi
and 802.15.4 (XBee)
- LAN via USB
(primarily used for debugging)
- Atmel hardware TPM
on I2C bus

Hardware/Software Stack

- Embedded linux system (Angstrom based)
- Custom kernel with TPM integration
- Customized TrouSerS software stack for TPM access
- Component based application development framework

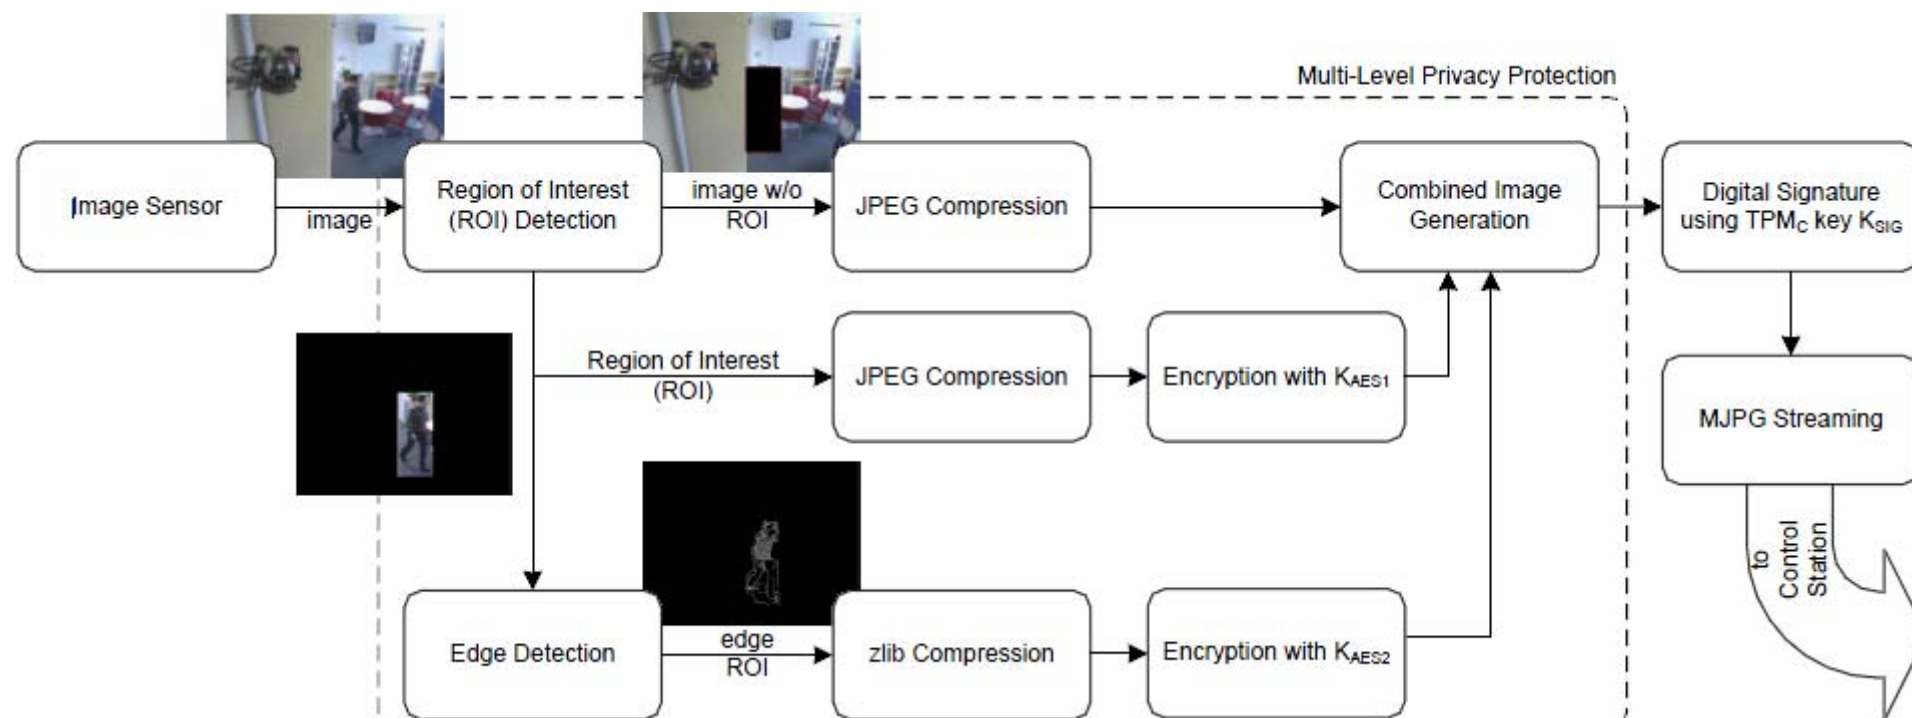

Architecture Overview

- Each Camera is equipped with a TPM called TPM_C

- Cameras are controlled from central back-office

Multi-level security and privacy

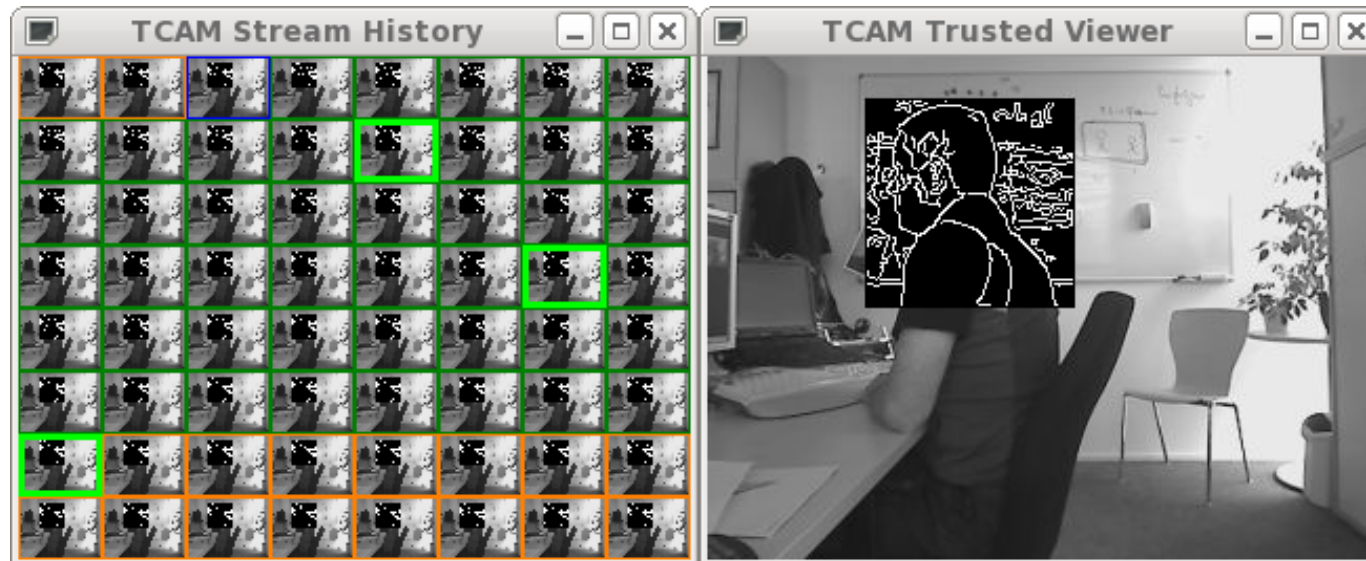

Perform cryptographic operations onboard

Signing: integrity and authenticity

Encryption: confidentiality and multi-level access control

Control Station

- Video viewer prototype
- Abstracted regions of interest
- Frame groups signatures embedded as custom EXIF data
- History: circular buffer with last 64 frames
 - Unverified frames: orange
 - Verified frames: dark green
 - Last frame of group: light green

Example 4: Authentic User Feedback

- How to **certify** what a camera is doing?
- An authentic communication channel between user & camera
 - Wireless channel is problematic
- Alternative: **visual communication** for device pairing
 - direct line of sight - attackers are easy to spot
 - intuitive way to select the intended camera
- Camera returns a list of hash sums of executed applications
- TrustCenter helps to translate hash sums into properties

User Feedback- Camera Selection

- User is equipped with a trusted handheld device
- 2D barcodes displayed on the user's handheld
- Barcode encodes attestation request and a challenge

Feedback on Mobile Device

- Provide detailed results available to users
- Show running vision processing blocks and their interactions
- Present description and check sums of blocks

Camera Status Details

Basic Software Environment:

Component Name	Version	Comment
X-Loader	1.4.2	with TPM patches
U-Boot	2009.08	with TPM patches
Linux Kernel	2.6.33	with TrustCAM patc...
Firmware Image	TrustCAM 0.1	

Firmware Details:

Component Name	Version	Comment
libjpeg	6.2	vanilla
libvt	1.3.7	vanilla
TrouSerS	0.3.4	with I2C patch
libexif	0.6.16	vanilla

Vision Processing Chain:

```

    graph LR
      A[Image Acquisition] --> B[Segmentation / Motion Detection]
      B --> C[Face Detection]
      C --> D[Face Blurring]
      D --> E[ROI Encryption]
      E --> F[MJPEG Streaming]
  
```

Description and Properties:

This component separates foreground from background image regions. This segmentation, is a basic step for following computer vision processing.

The output of this block is the original image plus a binary image containing the foreground regions.

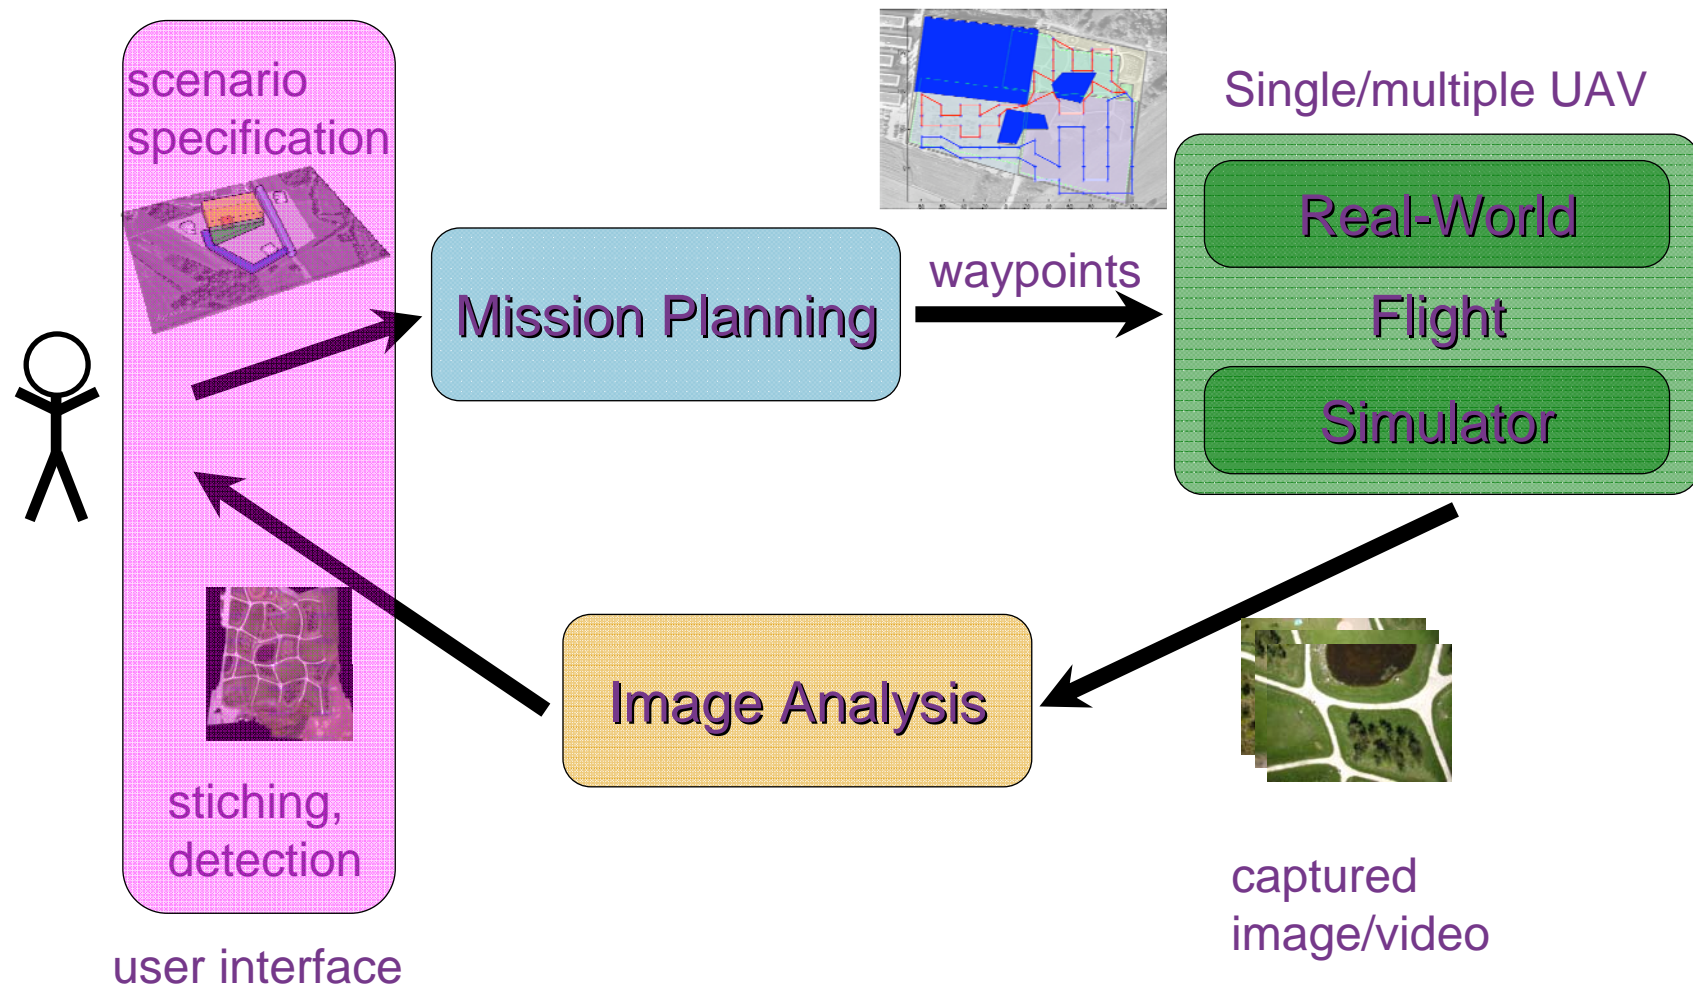

Vendor: Uni KLU **SHA1:** 1a33d54df20efd52f0ba130cd4ff4ce53185af6c

Example 5: Collaborative Aerial Cameras

- Develop **autonomous multi-UAV** system for aerial reconnaissance
- Up-to-date aerial overview images are helpful in many situations:
“**Google Earth with up-to-date images in high resolution**”
- **Quadcopter** platform with onboard sensors and computation
- GPS receiver for autonomous **waypoint flights**
- Limitations on payloads, flight time, weather conditions

Autonomous UAV Operation

User Interface

Define high-level tasks,
i.e., observation area

Real-time overview image
and execution status

Challenges

#1: Architecture

How to design resource-aware nodes and networks

- Low-power (high performance) camera nodes
 - Dedicated platforms: vision processors, PCBs, systems
 - Many examples: CITRIC, NXP
- Visual/Multimedia Sensor Networks
 - Topology and (multi-tier) architecture
 - Multi-radio communication
- Dynamic Power Management
 - For sensing, processing and communication

#2: Networking

How to process and transfer data in the network

- Ad hoc, p2p communication over wireless channels
 - Providing RT and QoS
 - Eventing and/or streaming
- Dynamic resource management
 - (local) computation, compression, communication, etc.
 - Degree of autonomy: dynamic, adaptive, self-organizing
 - Fault tolerance, scalability
 - Network-level software, middleware

#3: Deployment, Operation, Maintenance

Consider the entire life cycle of the camera network

- Development support for applications
 - Model/simulate the application (function, resources, QoS)
 - Reuse/exchange of software/libraries
 - Software updates, debugging etc.
- Autonomous calibration and scene adaptation
 - Avoid manual procedures
 - Adapt to different scenes and settings
- Network configuration

#4: Distributed Sensing & Processing

Where to place sensors and analyze the data

- Sensor placement, calibration & selection
 - Optimization problem
 - Distributed approaches eg., consensus, game theory, multi-agent systems
- Compressive Sensing
- Collaborative data analysis
 - Multi-view, multi-temporal, multi-modal
 - Sensor fusion
- Online/real-time processing
 - Can not effort to store large amounts of data

#5: Mobility

How to exploit networks of mobile cameras

- Mobile cameras are ubiquitous
 - PTZ, vehicles, robotics etc.
 - Mobile phones
- Advanced vision algorithms
 - Ego motion, online calibration
 - Closed-loop control, active vision

#6: Usability

How to provide useful services to people

- Ease of deployment, maintenance
 - Self-* functionality
 - “Smart cameras for dumb people”
- Privacy and Security
 - Trust of the user
 - Control the privacy setting
- Interaction with the camera network

#7: Applications

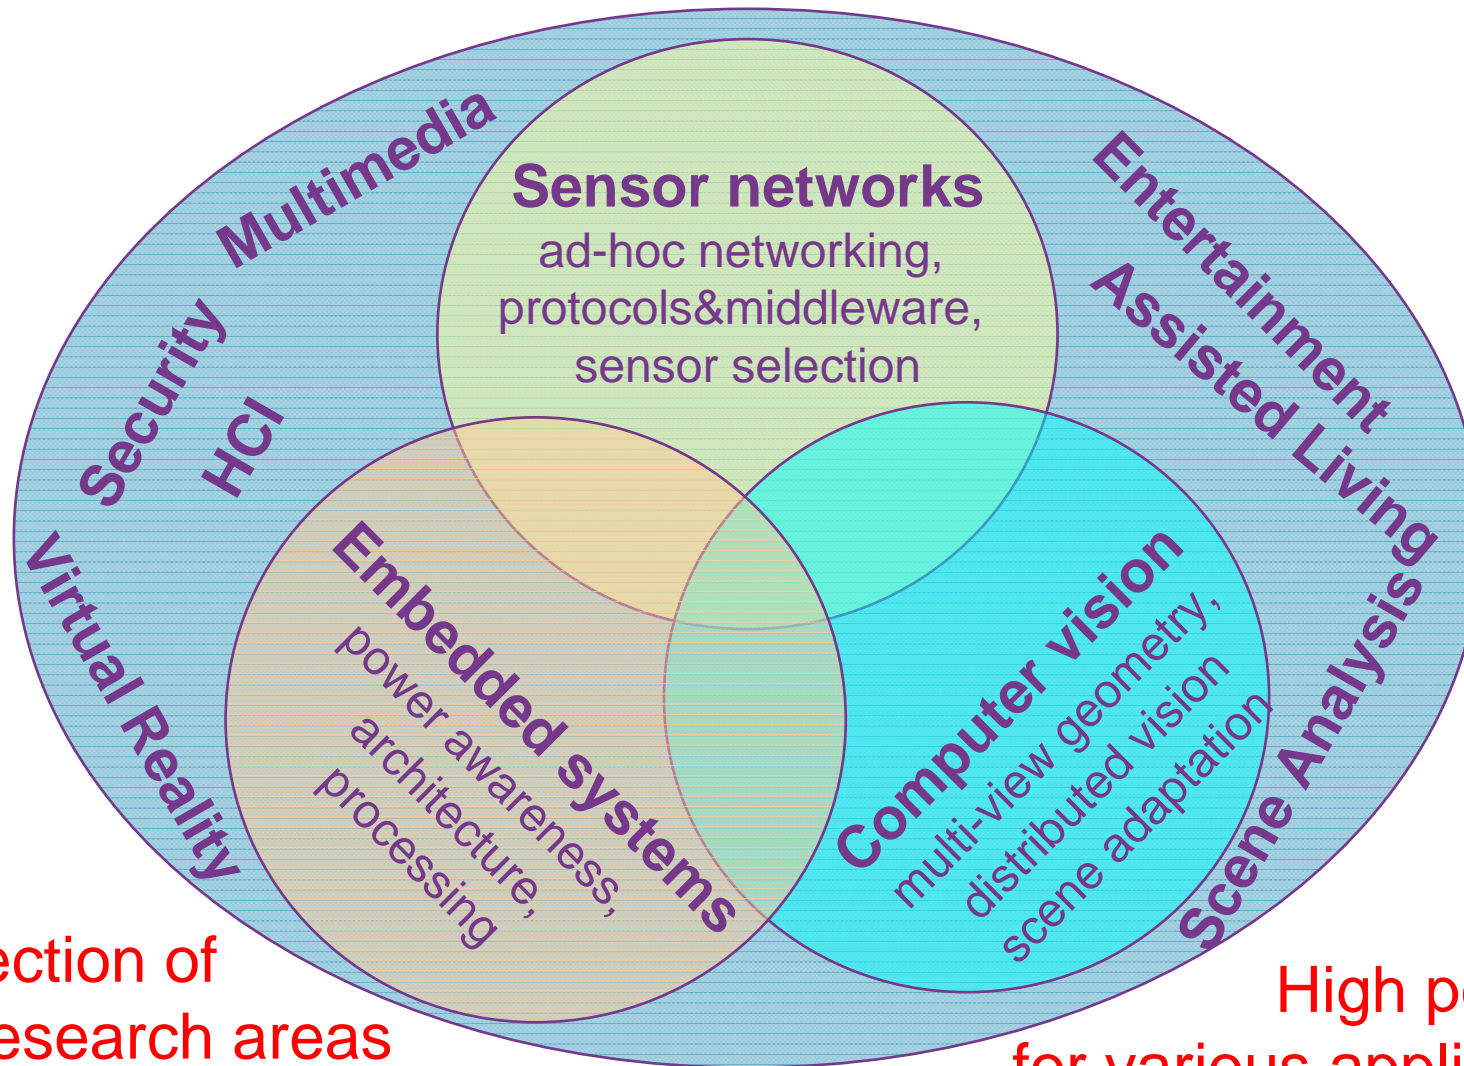

What applications can (only) be solved by DSC

- Demonstrations
 - Large scale networks eg., for surveillance
 - Small scale networks eg., for entertainment, home environments
 - Only single camera application?
- Market opportunities
- Killer Application

Smart Cameras

- combine
 - sensing,
 - processing and
 - communicationin a single embedded device
- perform **image and video analysis** in **real-time** closely located at the sensor and transfer only the results
- **collaborate** with other cameras in the network (multi-camera system)

DSC is Interdisciplinary Research

Intersection of
“hot” research areas

High potential
for various applications
